Project Name	Order On The Go: Your On-Demand Food Ordering Solution
Maximum Marks	4 Marks

## Solution Architecture – SB Foods

### Goals of the Architecture

- Provide the best technical solution to address late-night food ordering and restaurant management challenges.
- Clearly describe the structure, behavior, and flow of the system to stakeholders.
- Define features, development phases, and solution requirements.
- Deliver specifications for deployment, scalability, and performance.

### Architecture Description

The SB Foods solution follows a **3-tier MERN architecture** with integrations for payments, notifications, and restaurant dashboards.

- Frontend (Client Layer)**
  - Built with **React.js, HTML, CSS, JavaScript**.
  - Provides user interface components: registration, login, product catalog, cart, order placement, profile, and admin dashboard.
  - Responsive design for both web and mobile.
- Backend (Application Layer)**
  - Developed using **Node.js + Express.js**.
  - Exposes RESTful APIs for user authentication, product browsing, cart operations, order placement, and admin management.
  - Integrates with external APIs (Google Maps for delivery, Firebase for notifications, Stripe/Razor pay for payments).

- 3. Database Layer**
  - **MongoDB Atlas (NoSQL)** stores collections for Users, Restaurants, Products, Carts, and Orders.
  - Ensures scalability and high availability.
  - Supports indexing and optimized queries for performance.
- 4. External Services**
  - **Payment Gateway:** Stripe/Razor pay for secure transactions.
  - **Notification Service:** Firebase Cloud Messaging for order updates.
  - **Location Service:** Google Maps API for delivery tracking.
  - **File Storage:** AWS S3 for product images and user profile pictures.
- 5. Infrastructure**
  - Deployment on **AWS EC2 / Kubernetes** for scalability and resilience.
  - Load balancers ensure high availability.
  - CDN (Cloudflare) improves performance and response times.
